

Electricity truly is a technology of today and future life. People develop many various devices that based on its properties. Also new technologies appear thanks to electricity. But at what cost are we provided with the electrical devices? One can say that there is too many devices. The materials they are made of can be eco-friendly, but their production still pollutes environment. And it makes environmental problems. While enterprises produce the devices, they create the pollution. Electrical power is mostly generated not at a solar or hydroelectric power plants, but at coal power plants, for example. And let's not forget about the transportation. Also during the extraction of lithium the soil becomes dry. But it is lithium that batteries are made from. So though electrical devices are an important part of our lives, but it is also necessary to remember about all stages of their creation.
